

BLAST

Blast is a solvent based, water miscible wash carefully formulated to thoroughly clean and rejuvenate printing blankets and inking rollers. Regular use will prolong the life of both blankets and rollers by replacing essential plasticisers, which are leached out of the rubber surface in normal use. Blast has particularly high cutting solvent characteristics and is often used when making a quick or critical colour change. Blast is also recommended for use as the final wash-up at the end of a week.

- Removes ink and varnishes and when mixed with water it will also remove gum glaze, paper lint and other water soluble contaminants
- Reduces tack
- Restores blanket surfaces to near-new condition
- Increases roller and blanket life by replacing leached out plasticisers

Blast is suitable for use on all types of blankets and most types of rollers, including polyurethane but excluding EPDM rollers.

DIRECTIONS FOR USE

Blankets: Apply with a lint-free cloth. After application, it is good practice to wipe over the blanket with water, especially if an immediate start-up is required. To maintain the resiliency of the rubber, Blast should be used at least once a week.

Rollers: Blast can be used for the whole cleaning job or as a final treatment after the bulk of the ink has been cleaned off using an ordinary solvent. It is recommended to flush out the rollers with water before re-inking.
